MADE FOR HANNAH

Gaus

Your games update themselves while you are out.

Gaming · Automated · Updating · Service | all times are SAST

Hi Hannah,

Games get patched at certain times every week, and the downloads can be huge. **Gaus** is a small app that watches for those patches, opens the game's launcher (Steam, Epic, GOG, EA, Ubisoft, Battle.net, Riot, Xbox or any other) so it can download them, waits until it is finished, and then shuts the PC down. You come home to games that are already up to date. Set it up once and you never have to think about it again.

How it works

1

Wakes up

If the PC is asleep, it wakes a few minutes before the update time.

2

Checks

Steam: compares your version with the newest. Other launchers: it opens them and watches.

3

Downloads

The launcher downloads the update while a photo slideshow shows progress.

4

Shuts down

When done and nobody is using the PC, it shows a countdown, then shuts down.

What you get

Accounts, no passwords
Curtley and Hannah each get their own account with their own launchers and games. Switch with one click.

Every launcher
Add Steam, Epic, GOG Galaxy, EA app, Ubisoft Connect, Battle.net, Riot, Xbox or your own. Each has its own games.

Wakes from sleep
If the PC is asleep, it wakes itself shortly before an update.

Loading screen
A slideshow of free-to-use photos that match the game, with credits.

Safe power-down
It waits until the PC is idle, shows a cancel countdown, and stays on if an update failed.

Updates itself
New versions of Gaus install quietly by themselves when nothing is downloading.

Setting it up

Once, about 10 minutes

1 Put the app in a permanent folder

Make a folder such as **C:\Users\Hannah\Gaus** and put **Gaus.exe** in it. Please do not run it from Downloads or Program Files, because the app needs to be able to update itself there.

2 Open it and allow the Windows warning

Windows may say **"Windows protected your PC"** because the app is not from a big company. Click **More info**, then **Run anyway**. This only happens the first time.

3 Say whose account it is

The Gaus logo appears and then the window opens. It asks for a name. Type **Hannah**. There is no password, an account just keeps your launchers and games apart from Curtley's.

4 Add your launcher

Click **+ Add launcher**, pick the one you use (for example **Epic Games Launcher**) and click **Save**. Gaus finds it by itself. If it does not, press **Browse** and choose the launcher's .exe file.

5 Make the launcher keep your game updated

Inside the launcher, turn on **automatic updates** for the game. In Steam: right-click the game, **Properties**, **Updates**, **Always keep this game up to date**. Gaus only opens the launcher, the launcher does the downloading, so stay signed in (tick **Remember me**).

6 Add your games

Click **+ Add game**. For Steam, search for the game and pick it. For other launchers, pick it from the list or just type its name exactly as the launcher shows it, then click **Add game**.

7 Check the update times

Click the game, then **Schedule & photos**. New games start at every day 11:00 SAST. Set the days and times that game usually patches.

8 Choose your settings

Open the **Settings** tab. Switch on **Start with Windows** so it is always running. Keep **Power the PC down when updates have finished** on and leave the choice on **Shut down**. Click **Save settings**.

9 Optional: waking from sleep

Only matters if you leave the PC asleep instead of switched off. In Settings click **Check wake setup**, then **Test wake (2 min)**, and put the PC to sleep yourself. It should wake after about 2 minutes. The **Log** tab will say *Wake timer 'test' fired*.

10 Do one safe practice run

Switch on **Dry run** in Settings (it does everything except the power-down), click a game and press **Check now**. Switch Dry run off when you are happy. A manual **Check now** never powers the PC down by itself.

About the lock screen

After waking, the PC may show the Windows sign-in screen. That is fine. Gaus keeps working while the PC is locked and the launcher still downloads, so there is no password to enter.

Day to day

You do not need to do anything. These are just handy to know.

Where	What it does
Account buttons (top right)	Click a name to switch accounts. **+ New account**, **Edit** and **Delete** sit next to them.
Launcher buttons	Pick one launcher to see only its games, or **All launchers**. Add or remove launchers next to them.
Games table	Each game's installed build, the latest build, the next update window and what it is doing right now.
Preview slideshow	Shows the loading screen. Press **Esc** or click to close it.
Tray icon, right-click	**Open**, **Account**, **Check all games now**, **Show loading screen**, **Pause scheduling** and **Quit**.
Log tab	A plain record of what the app did. Send it to Curtley if something looks wrong.

New versions of the app

Gaus looks for new versions about every four hours. When one is ready it installs itself, quietly, as soon as nothing is downloading, and restarts. Your accounts, games, schedules and settings are kept. If you switch the automatic install off in Settings, a banner appears at the top with **Install and restart** instead.

Good to know

Limit	Why
Steam is checked exactly, other launchers are watched	Steam tells Gaus whether a newer version exists. Epic, GOG and the others do not, so Gaus opens the launcher and watches its disk activity. It treats the game as updated only if the launcher really downloaded something.
A PC that is switched off stays off	A wake timer can wake a PC from **sleep** or **hibernate**, never from a full shutdown. After it shuts down, the PC needs to be switched on again, or left asleep next time (choose **Sleep** in Settings).
Same game, two accounts	If Curtley and Hannah both have a game, it is only updated once.
It needs the internet	After waking it waits for the connection, gives up after about 10 minutes, and leaves the PC on.

If something goes wrong

What you see	What to try
Status says **Skipped** or **Launcher not found**	Open **Launcher settings** and press **Browse** to point Gaus at the launcher's .exe.
The launcher opened but nothing downloaded	Turn on automatic updates for the game inside the launcher itself.
The launcher asks you to sign in	Sign in once with **Remember me** ticked.
The PC did not wake	Run **Check wake setup** and **Test wake (2 min)** in Settings. Make sure the PC was asleep, not shut down.
The PC stayed on after the update	An update failed, someone was using the PC, or the countdown was cancelled. The Log tab says which.
Photos column shows 0	The photos are still downloading or the internet was down. Click **Refresh photos**.
The window will not open	Gaus needs Microsoft Edge WebView2, which comes with Windows 11 and Microsoft Edge. Tell Curtley.

Still stuck?

Open the **Log** tab and click **Open data folder**, then send Curtley the file **scheduler.log**. It records exactly what happened and when.
